                                                                               This peptide comprises amino acid residues 172-178 in the DEF box cregion (see AAW30501) of transcription factor DP1. Claimed peptides (II) (see AAW30502-07) containing this and/or another motif (see Cath AW30502) of the DEF box, are antagonists of the heterodimeriaation of a DP protein with an E2P protein. Also claimed are variants of these peptides, especially containing substitutions of residues of these peptides, especially containing substitutions of residues of these peptides, especially containing substitutions of residues of these peptides (see AAW30508), expression vectors encoding (I)-(III) and sequence (see AAW30508), expression vectors encoding (I)-(III) and sequence (see AAW30508), expression vectors encoding (I)-(III) and sequence (see AAW30508), expression vectors encoding (I)-(III) and sequence (see AAW30508), expression vectors encoding (I)-(III) and sectors encoding (I)-(III) are used therator of sequence angiopathy to induce apoptosis, of the DNA-binding activity of DP/EZF heterodimers. They are also the vector and as immunoassay conclered in the DNA-binding activity of DP/EZF heterodimers. They are also enteritying antagonists of DP-I/EZF dimerisation and as immunoassay conclered angels encoding (I)-(III) to control DP levels in calls, or extostatic agents, (I)-(III) enhance cell killing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

This represents a compound that can inhibit E2F activity. The compound is of the formula R1 - A - R2 where R1 is an optionally substituted alkanoyl, alloyl, herero-arylcarbonyl, alkoxycarbonyl, aryloxycarbonyl, hetero-aryloxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy or amino, and A is an E2F family dimer forming region or DNA binding region, of at least 12 consecutive amino acids. Compounds of this formula can be used to inhibit E2F activity, and are useful in the treatment and prevention of tumours and arteriosclerosis.
                                                                                                                                                                                                           ö
                  Peptide H6 comprises amino acid residues 167-180 in the DEF box region (see AAM30501) of transcription factor DP1. Unlike claimed peptides (see AAM30504-07) that contain one or both of 2 motifs (see AAW30502-03) of the DP1 DEF box, peptide H6 is not capable 6 antagonising the heterodimerisation of a DP protein with an E2F protein. The claimed peptides, their variants and fusion proteins can be used to induce apoptosis, specifically in tumour and cardiovascular cells, e.g. to prevent restenosis.
                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             E2F activity inhibitors - for treatment and prevention of tumours and arteriosclerosis
                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide H5 comprises amino acid residues 168-183 in the DEF box (II) (see AAW30501) of transcription factor DP1. Claimed peptides (II) (see AAW30504-07) containing one or both of 2 mortifs (see AAW30502-03) of the DEF box are capable of antagonising the heterodimerisation of a DP protein with an E2F protein. Also claimed are variants of these peptides, especially containing substitutions of residues correspondies (II) and a membrane translocation sequence (see AAW30508), expression vectors and 175 of DP-1, fusion proteins (III) comprising (I) or (II) and encoding (I)-(III) and host cells. (I)-(III) are used to therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging bone marrow. Surgical stents comprising (I)-(III) are used to treat or prevent restenosis in patients who have undergone angioplasty. (I) (III) function by inactivating the DNA-binding activity of DP/E2F heterodimers. They are also used as research reagents as positive controls in assays for identifying antagonists of DP-1/E2F dimerisation and as immunoassay agents. Also described is the use of sequences antisense to nucleic acids encoding (I)-(III) to control DP levels in cells, particularly by gene therapy. When formulated with cytotoxic or cytostatic agents.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide H2mt2 is based on peptide H2 (see AAW30504) from the DEF box (see AAW30501) of transcription factor DP1. In H2mt2, amino acid residues of H2 that correspond to DP1 residues Arg167 and Asp171 are substituted by Ala residues. H2 is an antagonist of the heterodimerisation of DP1 with E2F. H2mt2 retains some, but not all, of this antagonistic activity. H2 and other claimed peptides (see AAW30504-07) from the DEF box region of DP1 can be used to induce apoptosis, specifically in tumour and cardiovascular cells, e.g. for the prevention of restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis

Peptide H2 comprises amino acid residues 166-184 in the DEF box (I) (see AAW30501) of transcription factor DP1. Claimed peptides (II) (see AAW30501) of transcription factor DP1. Claimed peptides (II) (see AAW30504-07) containing one or both of 2 motifis (see AAW30502-03) of the DEF box are capable of antagonising the AAW30502-03 of the DEF box are capable of antagonising the beterodimerisation of a DP protein with an E2F protein. Also claimed are variants of these peptides, especially containing anbetrutions of residues corresponding to residues 167, 169, 171 and 175 of DP-1, fusion proteins (III) comprising (I) or (II) and and 175 of DP-1, fusion proteins (III) comprising (I) or (III) and host cells. (I) (III) are used to therapeutically to induce apoptosis, specifically in tumour or therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging create or prevent restenosis in patients who have undergone treat or prevent restenosis in patients who have undergone andioplasty. (I) (III) function by inactivating the DNA-binding cactivity of DP-1/E2F dimerisation and as immunosassy agents. They are also used as research antagonists of DP-1/E2F dimerisation and as immunosassy agents. Caccing (I)-(III) to control DP levels in cells, particularly by control DP levels in cells, particularly by control DP levels in cells, particularly by control DP levels in cells, particularly by control DP levels in cells, particularly by control DP levels in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis

```

```
This represents a compound that can inhibit E2F activity. The compound is of the formula R1 - A - R2 where R1 is an optionally substituted alkanoyl, alloyl, hetero-arylcarbonyl, alkoxycarbonyl, aryloxycarbonyl, hetero-aryloxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy or amino, and A is an E2F family dimer forming region or DNA binding region, of at least 12 consecutive amino acids. Compounds of this formula can be used to inhibit E2F activity, and are useful in the treatment and prevention of tumours and arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            E2F activity inhibitors - for treatment and prevention of tumours and arteriosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

Peptide H7 comprises amino acid residues 170-199 in the DEF box (II) (see AAW30501) of transcription factor DP1. Claimed peptides (II) (see AAW30504-07) containing one or both of 2 motifs (see AAW30502-03) of the DEF box are capable of antagonising the heterodimerisation of a DP protein with an E2F protein. Also claimed are variants of these peptides, especially containing substitutions of residues corresponding to residues 167, 169, 171 and 175 of DP-1, fusion proteins (III) comprising (I) or (II) and a membrane translocation sequence (see AAW30508), expression vectors encoding (I)-(III) and host cells. (II-) are used to therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging bone marrow. Surgical stents comprising (I)-(III) are used to treat or prevent restenosis in patients who have undergone artivity of DP/E2F heterodimers. They are also used as research reagents as positive controls in assays for identifying activity of DP/E2F heterodimers. They are also used as research reagents as positive controls in assays for identifying antagonists of DP-1/E2F dimerisation and as immunossay agents. Also described is the use of sequences antisense to nucleic acids encoding (I)-(III) to control DP levels in cells, particularly by the present the part of premalated with cytotoxic or cytostatic agents.
                                                                                                                                                                                                                                                                                                                    Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DP-1; transcription factor; antagonist; E2F protein; apoptosis; cell proliferation; cardiovascular cell; restenosis; tumour; surgical stent; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This represents a compound that can inhibit E2F activity. The compound is of the formula R1 - A - R2 where R1 is an optionally substituted alkanoyl, alloyl, hetero-arylcarbonyl, alkoxycarbonyl, aryloxycarbonyl, hetero-aryloxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy or amino, and A is an E2F family dimer forming region or DNA binding region, of at least 12 consecutive amino acids. Compounds of this formula can be used to inhibit E2F activity, and are useful in the treatment and

This sequence represents 42% of the middle region of soybean cell cycle regulatory protein DP-1, as deduced from an isolated cycle regulatory protein DP-1, as deduced from an isolated coll cycle regulatory protein by the invention relates to mucleic acid cand cargonize (see AAZ34579). The invention relates to uncleic acid cand construction of a chimeric gene encoding all or a relates to the construction of a chimeric gene encoding all or a contentation, where expression of the chimeric gene results in principal conformations of altered levels of the chimeric gene results in production of altered levels of the cell cycle regulatory protein in production and the candidates are active and proteins may be considered for facilitate studies of cell cycle regulation in plants, provide genetic tools to enhance cell growth in tissue culture, provide genetic tools to enhance cell growth in tissue culture, increase gene transfer efficiency and provide more stable transfer efficiency and provide targets to transformations. The proteins may also provide targets to transfer design and/or identification of cell cycle regulatory proteins that may be useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 31; DB 20; Length B3; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide H (I) comprises residues 163-199, i.e. the DEF box region, of transcription factor DP1. Claimed fragments (II) (see AAW30502-07) of (I) are capable of antagonising the heterodimerisation of a DP protein with an B2F protein. Also claimed are fusion proteins (III) comprising (I) or (II) and a membrane translocation sequence (see AAW30508), expression vectors encoding (I) (III) and host cells. (I) (III) are used therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging bone marrow. Surgical stents comprising vitro, e.g. for purging bone marrow. Surgical stents comprising (I)-(III) are used to treat or prevent restenosis in patients who have undergone angioplasty. (I)-(III) function by inactivating the DNA-binding activity of DP/E2F heterodimers. They are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                         Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (I)-(III) are used angioplasty. (I)-(III) runction of they are also have undergone angioplasty. (I)-(III) runction of they are also the DNA-binding activity of DP/E2F heterodimers. They are also used as research reagents, as positive controls in assays for identifying antagonists of DP-1/E2F dimerisation and as immunoassay identifying antagonists of DP-1/E2F dimerisation and as immunoassay agents. Also described is the use of sequences antisense to agents. Also described is the use of sequences antisense to nucleic acids encoding (I)-(III) to control DP levels in cells, nucleic acids encoding (I)-(III) to formulated with cytotoxic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel cell cycle protein (CCP) and the polymorlacutides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the polypeptide and an anti-CCP antibody is useful for detecting the presence of CCP in a sample. A CCP modulator is useful for detecting the presence cycle crycle or growth of a plant such as Arabidopsis thalians, rice, wheat, maize, tomato, alfalfa, oilseed tape, soybean, sunflower and canola. Cycle nucleic acid and polypeptide molecules are useful as modulating of CCP nucleic acid and polypeptide molecules are useful as modulating of cry protein or production of CCP protein forms which have decreased or agents in regulating cell cycle progression in plants. CCP is useful to compute the activity computed are useful as metality or modulate the activity of ECP protein forms which have decreased or the polymorleotide are useful as herbicides or plant growth regulators. The polymorleotide is useful for modifying cell fath engine development, the polymorleotide is useful for modifying cell fath of the GI, S GZ and/or M phase of the cell division, Mwarfism in plants. S GZ and/or M phase of the cell division, Mwarfism in plants, initiation and/or development, thouse, fruit, leaf formation, seed set, seed development, thouse, fruit, leaf formation, seed set, initiation and/or development, nodule function, dwarfism in plants, initiation and activity of a protein in agriculture to modulate the protein levels or activity of a protein involved in the cell cycle due cold, nutrient deprivation, heat, drought, salt stress or biotic stress such as pathogen attack, to modulate e.g. enhance cold attenuate plant architecture, plant quality traits, CP protein levels or activity of a protein in storage cells, carge tissues and/or storage organs of plants or its parts. CC sorage tissues and/or storage organs of tissues and/or storage organs are insumanogen to generate antibodies. CCP protein is a corpored risues, plant quality, 
                                                                                                            Cell cycle protein, CCP, cell cycle regulation, herbicide, plant growth regulator, plant development, abiotic stress, biotic stress; nutrient deprivation; pathogen attack; crop yield; motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New cell cycle protein and nucleic acid molecule encoding it useful for regulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators
                                                               Plant dimerisation protein (DP) E2F heterodimerisation domain #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Magyar

                                                                                                                                                                                                                                            Peptide H2mtl is based on peptide H2 (see AAW30504) from the DEF box (see AAW30501) of transcription factor DP1. The H2mtl peptide in which H2 residues corresponding to DP1 residues Val169 and Val175 are substituted by Ala residues, behaves in a similar fashion to the wild-type H2 peptide in its ability to inactivate E2F site DNA binding activity in D9 EC cell extracts. H2 is an antagonist of the heterodimerisation of DP1 with E2F. Thus, the Val-169 and Val-175 residues of H2 play little role in this activity. H2 and other claimed peptides (see AAW30504-07) from the DEF box region of DP1 can be used to induce apoptosis, specifically in tumour and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cell cycle protein; CCP; cell cycle regulation; herbicide; plant growth regulator; plant development; abiotic stress; biotic stress; nutrient deprivation; pathogen attack; crop yield; motif.
                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to scorpion toxins. The invention may be used for the creation of transgenic plants which express K-channel modifiers, useful as a means for controlling insect peets by producing insect-colerant plants. In the prevention and/or treatment of insect pest damage and parastric worm infections in animals and humans, the invention may also find use in creating specific new pesticides and antihelmintic drugs that are also non-toxic to humans, pets and
                                                                                                                                                                                                                                                                                                                                  New polynucleotides encoding scorpion venom potassium-channel agonist proteins for production e.g. of insect-tolerant transgenic plants for controlling insect pest damage and parasitic worm infections -

The invention relates to a novel cell cycle procein (CCP) and the copymucleotides encoding them. CCP is useful for identifying a compound copymucleotide and anni-CCP antibody is useful for detecting the presence of cycle or growth of a plant each which binds to the polypeptide and an anni-CCP antibody is useful for detecting the presence of CCP in a sample. A CCP modulator is useful for medulating the cell coff coff of a plant such as Arabidopsis thalians, rice, wheat, cycle or growth of a plant such as Arabidopsis thalians, rice, wheat, coff coff and polypeptide molecules are useful as modulating to compare the regulation collised trape, soybean, sunflower and candla. CC agents in regulating cell-cycle progression in plants. CCP is useful to a percent forms which have decreased or compounds that bind to or modulate the activity compounds that bind to or modulate the activity. Compounds that bind to or modulate the activity compounds that bind to or modulate the activity. Compounds that bind to or modulate the activity of polymentiation or enhancement of cell division, by production, so and/or M phase of the cell cycle of a plant, initiation, promotion, so and/or M phase of the cell cycle of a plant, initiation, seed set, crimilation or enhancement to cell division, My replication, seed set, initiation and/or development, thodule function, dwarfism in plants. CC seed size, seed development, thodule function, dwarfism in plants or intiation and/or development, modula function, dwarfism in plants. CC protein levels or activity of a protein involved in the cell cycle due cond, intromental conditions, including abiotic stress such as coling and activity of a protein in decrease corp yields, and attenuate plant architecture, plant duality traits, plant creases much as pathogen attack, to modulate e.g. enhance crop yields, carcage issues and/or storage organs of plants or its parts. CCP is creen for naturally occurring CCP pathoracy. The proper is enhance corp yields, croscell is an immunogen to generate antibodies. 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; secreted protein; cytostatic; anti-proliferative; vulnerary;

                                                                                                                                                                                                                                                                                                                                    The polynucleotide sequences given in AAA39052 to AAA39088 encode the human secreted proteins given in AAB08891 to AAB08984. The human secreted proteins given in AAB08891 to AAB08984. The human secreted proteins given in AAB08891 to AAB08984. The human secreted cells they are expressed in. Examples of the activities are: cytostatic; anti-proliferative; immunosuppressive; antibacterial; and vulnerary. The secreted proteins and their related polynucleotide sequences are useful to diagnostic and therapeutic methods useful for diagnosing and treating disorders related to the secreted proteins. The proteins and proteins of the immune system, hyperproliferative disorders, infectious disease commune system, hyperproliferative disorders, infectious disease.

The proteins The proteins or polynucleotide sequences may be used as food additives or preservatives, to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, and animerals, co-factors or other nutritional components. Agonists or mannerals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

AAC97891 to AAC88763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB51214 to AAB54006. The human colon cancer antigens can have cytostatic, candioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antilnfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune strength and cardiovascular disorders, and cardiovascular disorders, and cardiovascular disorders, AAC98764 to AAC98772 and AAB54007 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; cytokine; cell proliferation; cell differentiation; gene therapy, accine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodilatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                              The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymortocides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                  The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a protein of the invention.

(HYSE-) HYSEQ INC
```

```
This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAV34277) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 28 novel genes and their fragments (nucleic acid sequences: AAV34286-V34325; amino acid sequences AAW75196-W7535) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 28 polyhoucleotides, based on which tissues they are most highly expressed in
                                                                                                                                                                                  Isolated human poly:nucleotide(s) encoding secretory peptide(s) used to develop products for the diagnosis and treatment of e.g. inflammation, cancers, CNS disorders or immune system disorders

Claim 11; Page 193; 209pp; English.

AMD44636-AAD44676 represent cDNAs corresponding to 28 human secreted protein genes, and AAE26959-AAE26999 represent the proteins they encode. AAE27000-AAE37025 represent human secreted protein fragments or their variants. The secreted protein fragments or their variants. The secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therety. Specific uses are described for each of the 28 genes, based on the tissues in which they are most highly expressed and include contential memaclobulinaemia, B cell immunodeficiencies, severe combined immunodeficiencies, autoimmune disorders e.g., systemic lupus erythematosus, rheumatoid arthritis, multiple sclerosis, autoimmune to combined immunodeficiencies, autoimmune disorders e.g., systemic lupus erythematosus, rheumatoid arthritis, dermatitis, inflammatory conditions including septic shock, sepsis, reperfusion injury, inflammatory bowel disease, memolytic anaemia; goodpasture's syndrome, disorders e.g., asthma and allergy, gastrointestinal disorders e.g., inflammatory bowel disease, hameacopoietic disorders, vespiratory disorders e.g., asthma and allergy, gastrointestinal disorders e.g., inflammatory bowel disease, hameacopoietic disorders, covarian, lung, cancers e.g., gastric, ovarian, lung, disorders e.g., asthma and Alzheimer's disease, AlDS-related dementia and prion disease, and allogenic transplant rejection, blood-corporated disorders e.g., hepatitis, gout, trauma, pancreatitis, sarcoidosis and allogenic transplant rejection, blood-corporated disorders, respiratory disorders e.g., hepatitis, neurological diseases, hubberaliultarism, infectious diseases and reproductive system (Crelated disorders, endocrine disorders e.g., hyperthyroidism, Addison's liver disorders, endocrine disorders e.g., hyperthyroidism, hyders, inference e.g., hyperthyroidism, hyders, inference e.g., hyperthyroidism, hyders, hypersesents endocrine disorders e.g., hyperthyroidism, hyders, hyperpolitiers, endocrine disorders e.g., hyperp

                                                                                                                                                    ADD44854-AAD44984 represent CDNAs corresponding to 28 human secreted CC protein genes, and AAEZ7137 represent the proteins they encode. CC protein genes, and AAEZ7137 represent the protein strangments. The genes AAEZ7138-AAEZ7164 represent human secreted protein fragments. The genes CC and their corresponding secreted proteins are useful for preventing, corresponding secreted proteins, e.g., by protein or gene therapy. Secreted protein sequences of the invention are useful for the corresponding medical conditions, e.g., by protein or gene therapy. Secreted protein sequences of the invention are useful for the corresponding arthritis), hyperproliferative disorders (e.g. neoplasms of rhe breast or liver), cerebrovascular disorders (e.g. neoplasms of system disorders (e.g. cardiac arrest), nervous cystem disorders (e.g. Alzheimer's disease), infections caused by fungi, system disorders (e.g. correlai ischemmia, corporation, to prevent skin ading due to sunburn, to maintain organs proliferation, to prevent skin ading due to sunburn, to maintain organs corresponditures and order tanaplantation, for supporting cell culture of primary tissues, confict corresponditives or preservative to increase or decrease storage capabilities, and other untitional components. They can also be used as food and interest ingid, protein, carbohydrate, vitamins, minerals, cofactors
                        New nucleic acid molecules encoding 28 human secreted proteins, useful for diagnosing, preventing, treating or ameliorating medical conditions and as food additives or preservatives

The invention relates to an isolated polypeptide comprising an amino acid sequence at least 95% identical to sequence of 28 human secreted corresponding to a profession, epitope, secreted form, variant, allelic variant, or species homologue, or the encoded sequence included in ATCC 97921 and 97922. Also included are the encoding mucleic acids recombinant vectors, host cells, antibodies, and genes. The proteins and nucleic acids are useful for diagnosing, preventing, rreading, preventing, recombinant vectors, host cells, antibodies, and genes. The proteins and nucleic acids are useful for diagnosing, preventing, respiratories, severe combined immunodeficiencies, severe combined immunodeficiencies, severe combined immunodeficiencies, autoimmune thyroiditis, autoimmune hamolytic anaemia, classociatis (e.g. systemic erythematosus, rheumatoid arthritis, multiple discopature's syndrome, Grave's diabetes mellitus, dermatitis), hemmatopoietic disorders, inflammatory conditions (e.g. septic shock, sepsis reperfusion injury, inflammatory bowel disease, Crohn's disease), respiratory disorders (e.g. asthma and allergy), gastrointestinal breast). central nervous system (CRS) disorders (e.g. gischeemic brain injury), neurodegenerative disorders, cancers (e.g. asthma and allergy), gastrointestinal conditions and prion disease), cardiovascular disease, and cardiopulmonary bypass complications), inflammation (e.g. hepstitis, gout, trauma, pancreatitis, and prion disease), cardiovascular disease, and cardiopulmonary bypass complications), inflammation (e.g. hepstitis, gout, trauma, pancreatitis, sarcoidosis, dermatitis, alloganic transplant rejection), blood-related disorders (eng. and cardiopascular disease, and disease, and disorders (e.g. adute of gloomerulonephritis), endocrine disorders (e.g. adute of disorders (e.g. adute of disorders (e.g. adute of disorders and disorders (e.g. adute of engranderic disorders (e.g. adute of engranderic disorders (e.g. adute of engranderic disorders (e.g. adute of engranderic disorders (e.g

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, iduronate-2-sulfatase, IDS; liver, glycosylated, heparin sulphate, dermatan sulphate, lysosome, Hunter syndrome, severe mental retardation, skeletal deformity, stiff joint.
are useful to enhance or inhibit complement mediated cell lysis, for stimulating wound and tissue repair, angiogenesis, and the repair of vascular or lymphatic diseases or disorders. They are also useful to prevent hair loss, to modulate mammalian characteristics such as body height, weight, hair colour, and to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitemins, minerals, cofactors or other nutritional components. The proteins are represents a secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method has been developed for the production of glycosylated iduronate-2-sulphatase enzyme (IDS). The method comprises culturing a host cell containing a nucleic acid encoding the enzymatically active IDS polypeptide where the host cell glycosylates the polypeptide to a greater degree than a native IDS polypeptide expressed by a natural human liver cell. The present sequence represents an IDS amino terminal peptide used in an example from the present invention. The recombinant IDS is used to treat IDS deficiency where heparin sulphate and dermatan sulphate accumulates in lysosomes resulting in Hunter syndrome which is manifested by e.g. severe mental retardation, skeletal deformities and stiff joints. The recombinant IDS possesses inter alia an improved half life inter alia and improved uptake
                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Production of glycosylated iduronate-2-sulphatase enzyme (IDS) -comprises culturing a host cell containing a nucleic acid encoding the enzymatically active iduronate-2-sulphatase polypeptide

The present sequence is derived from human iduronate 2-sulphatase (IDS) protein, and is used to design a probe for the isolation of CDNA encoding IDS. The specification describes recombinant human IDS produced in eukaryotic cells that has enzymatic activity and is more highly glycosylated than native IDS from the human liver, placenta or kidney, The protein is useful for treating IDS deficiency,
                                                                                                                                                                                                               Human; iduronate 2-sulphatase; IDS; IDS deficiency; Hunters syndrome.

                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a human iduronate 2-sulphatase (IDS) peptide fragment. IDS deficiency can be treated by administering a recombinant human IDS that is more highly glycosylated than the naturally occurring enzyme, useful in the treatment of Hunter syndrome. The recombinant IDS may be administered in 0.5 microg/kg to 20 mg/kg doses. The administration route is oral, intravenous, intraperitoneal, intramesular, subcutaneous or intransaal. The recombinant IDS has better uptake properties and/or a longer half-life in vivo, and is thus more efficient than naturally glycosylated IDS.

The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a recombinant human iduronate 2-sulfatase (IDS). The recombinant IDS is more highly glycosylated than the naturally occurring enzyme isolated from human tissue. The recombinant human IDS can be produced in Chinese Hamster Ovary (CHO) cells or in a human cell. The recombinant IDS comprises a fusion protein. It is a mucopolysaccharidosis inhibitor and can be used in gene therapy. The recombinant IDS is useful in treating and diagnosing subjects suffering from or suspected of having IDS deficiency disorders, e.g. Hunter syndrome (mucopolysaccharidosis type II). The present sequence represents a human IDS peptide which is used to produce an
                                                                                                                                                                                                                                                                                                                                                                                                                   New highly glycosylated recombinant human iduronate 2-sulfatase (IDS) useful for diagnosing or treating subjects suspected of having or suffering from IDS deficiency disorders, e.g. Hunter syndrome

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protein #2182 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                 The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human feetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                            The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived nucleic acid probes to a collection of detectably labelled nucleic acids the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label cound to each probe of the microarray. The probes are useful for bound to each probe of the microarray. The probes are useful for encode proteins. They are useful for gene discovery, and for encode proteins. They are useful for gene discovery, and for encode proteins analysis is useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical diversity of probes for measuring gene expression, with far less bias diversity of probes for measuring gene expression, with far less bias diversity of probes for measuring gene expression, with far less bias contraction of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid manner and the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The sequence data for this patent did not form part of the Note: The sequence data for this patent did not format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human brain expressed single exon probe encoded protein SEQ ID NO: 27675.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                             Gaps

They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.

                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide #2188 encoded by probe for measuring breast gene expression.
                                                                                                                                                                                                                                                                                                               Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide #2318 encoded by probe for measuring placental gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                               The present invention relates to novel single exon nucleic acid probes such probe. The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human peptide encoded by genome-derived single exon probe SEQ ID 27154.
                                                                 Novel single exon nucleic acid probe used to measuring gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; single exon probe; asthma; lung cancer; COPD; ILD; chronic obstructive pulmonary disease; interstitial lung disease; familial lung disease; pulmonary fibrosis; neurofibromatosis; tuberous sclerosis; gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histicoytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasia; primary cillary dyskinesis; pulmonary hypertension; hyaline membrane disease.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from thuman lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12187 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes the novel set of probes the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring sene expression in a collection of detectably labeled nucleic acid derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acid derived from human lung a collection of detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene, comprising one of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene of 12011 sequences, mentioned in the specification, or encoded by the expression of the exons in a definite exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases (COMP), interstitial lung disease (ILDP), interstitial lung disease 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          haemosiderosis, pulmonary histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention.
                                                             Spatially-addressable set of single exon nucleic acid probes, used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, colon cancer; colon cancer antigen; diagnosis; detection; colorectal carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                               AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where cancer antigens are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic acid, and can be used in gene cancer tantigens have cytostatic acid, and production. N and P may be used in the prevention, therapy and vaccine production. N and P may be used in the prevention, clasmosis and treatment of diseases associated with the prevention of associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing to in a patient's genome that affect the activity of P by expressing to conscrive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, colorected cancer and AAH37196 to AAH37204 and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and and AAH37049.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The present invention describes substantially purified human proteins

(referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1

(referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1

c) in the specification). ABN15762 to ABN27252 encode the human ORFX

c) proteins given in ABP0010 to ORFX proteins are useful for

c) creating or preventing a pathology associated with an ORFX-associated

disorder in humans, and in the manufacture of a medicament for treating a

c) creating or preventing a pathology associated with an ORFX-associated

c) syndrome associated with ORFX-associated disorder. ORFX polymucleotide

c) syndrome associated with ORFX-associated disorders, cirrhosis of 11/err,

c) squences can be used in gene therapy. ORFX sequences can be used in the

c) psoriasis, bening tummours, kebloid, degenerative disorders, intendiated

c) psoriasis, bening tummours, kebloid, degenerative disorders, infectious

c) costeoarthritis, neurodegenerative disorders, disorders, infectious

c) costeoarthritis, autoimmune thyroiditis, myasthenia solarosis, infectious

c) clorage disease, various immune deficiencies and disorders, infectious

c) costeoarthritis, autoimmune thyroiditis, myasthenia grafts, graft-versus-host

c) costeoarthritis, autoimmune inflammatory eye disease. ORFX proteins are also

c) costeoarthritis, autoimmune inflammatory eye disease.

c) costeoarthritis, autoimmune inflammatory eye disease.

c) costeoarthritis, autoimmune inflammatory eye disease.

c) costeoarthritis, autoimmune inflammatory eye disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-SEP-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, Coryneform bacterium and identifying a homologue of a gene derived from oxide, nucleic acids, vitamins, saccharides and organic acids, in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                              Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention relates to the isolation of novel human respiratory antigens, and cDNA (AAS2/869-AAS28159) and genomic respiratory antigens, and cDNA (AAS2/869-AAS28159) and genomic respiratory antigens, and cDNA (AAS2/869-AAS28159) and genomic cord sequences encoding for these polypeptides. Treating and/or prognosing invention are useful for preventing, treating and/or prognosing disorders leaf. Phenomenia, allergic disorders e.g. asthma, allergic disorders e.g. asthma, concers of pleuristy, cystic fibrosis, emphysema, nose disorders and cancers of pleuristy, cystic fibrosis, emphysema, nose disorders and cancers of the respiratory tissues e.g. lung cancer. The polynucleotide sequences the respiratory tissues e.g. lung cancer. The polynucleotide sequences of the invention are useful in gene therapy and antisense therapy. ANUTYSES-ARUTYSES represent novel human respiratory antigens. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO cat fip. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; prostate cancer; prostate cancer antigen; detection; diagnosis; neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular; vulnerary; gastrointestinal; nephrotropic; antinfective; gynaecological; antibacterial; gene therapy; neural; immune; reproductive; renal; gastrointestinal; pulmonary; cardiovascular; proliferative disorder; wound; infectious disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as prostate cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gape
 Isolated polypeptide for treating, preventing and/ or prognosing disorders related to the respiratory system including respiratory cancers and also for testing and detection {\rm e.g.}, diagnosis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human prostate cancer antigen protein sequence SEQ ID NO:1456.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

          AAPI5566 to AAPI6505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56361 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases.                                                                                                                                                                                                                                                                                                                                                                                                                      유
```

The invention relates to novel isolated bone marrow-expressed

```
polymucleotide (I) (or its complement) comprising a sequence selected from 150 sequences of defined base pair sequences given in the specification, its mature coding portion or active domain coding portion.

(I) provided as a collection on a nucleic acid array is useful for detecting full-matches or mismatches to any one of the collection on a nucleic acid array is useful comparation in land its encoded polypeptides (II) are useful for treating inflammatory conditions such as arthritis, comparation and proliferation in increasing haematopoiesis, stem cell generation and proliferation in metastasis (II) is involved in cancer cell generation and proliferation in metastasis (II) and modulators of (I) are useful for creating transgenic animals useful for studying modulators or useful for creating transgenic animals useful for studying modulators of collypeptides (II) induces the proliferation of neurol cells and response and anyotrophic as well as for studying modulators of the polypeptide as well as for studying modulators of the polypeptide as well as for studying modulators of the polypeptide as well as for studying modulators of the polypeptide as well as for studying modulators of the creatment of nerve and brain tissue and is useful for treatment of central and peripheral nervous system diseases and anyotrophic lateral sclerosis. (II) is involved in chemotractic or chemokinetic activity, regulation of haematopoiesis and stonders such as thrombocytopenia and for regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, and in tissue repair, healing of burns, incisions, ulcers, for treating osteoporosis, constending the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the profice of the pro

```
The present invention relates to a vaccine for alleviating or preventing cautoimmune disorders induced by infection with Epstein-Barr virus (BEW), comprising BEW or its component in a carrier. The vaccine is useful for preventing or alleviating autoimmune disorders induced by EBW, e.g. preventing or alleviating autoimmune disorders induced by EBW, e.g. careful curve systemic lugus erythematosus (EBL), sjogener s syndrome, juvenile onset diabetes mallitus, rheumatoid arthritis, Wegener's granulomatosis, configuration at the standard provided in the standard provided in sease, adrenalitis, primary billary cirrhosis, demagnowish, multiple configurations and haemolytic anaemia, lupoid haparitis, demyelinating perindiculs and haemolytic anaemia, lupoid haparitis, demyelinating in the particular, pressler's syndrome, wystehenic layers, autoimmune cystitis, pemphigoid, dermaritis haparitis, alopecia areata, autoimmune cystitis, pemphigoid, dermaritis haparelic formis, alopecia areata, autoimmune cystitis, pemphigoid, dermaritis haparelicular, pressler's syndrome (articular), sclerosis, subbetes) male or female autoimmune inferrility, anticular cystitis, pemphigoid, sclerosis, systemic necrotising spondylitis, ulabetes) male or female autoimmune inferrility, analylosing spondylitis, ulabetes) male or female autoimmune inferrility, analylosing spondylitis, ulabetes) male or female autoimmune inferrility, and relanglecraisal, adult oner diabetes any submitties (Type II diabetes) male or female autoimmune inferrility, and relanglecraisal, atopic dermaritis, atopic dermaritis, and sease, maxed connective risue diaease, polyarteritis nodes, systemic necrotising carporering trisue diaease, polyarteritis in nodes, systemic necrotising erythema multiforme, posterony syndrome, custing, and sease, and posterony proderma gangrenome, custing, and and polycis, and proderma gangrenome, ribricange arcoindossum, transfund and solvanding syndrome, fibromyalgia, Takayasu's arteritis, wassaki's diaease, caplaris syndrome (triaditis, memo

This peptide comprises amino acid residues 175-183 in the DEF box region (see AAW30501) of transcription factor DP1. Claimed peptides (II) (see AAW30502-07) containing this and/or another motif (see AAW30502-07) containing this and/or another motif (see C AAW30503) of the DBE box, are antagonists of the heterodimerisation of a DP protein with an B2F protein. Also claimed are variants of these peptides, especially containing substitutions of residues of these peptides, especially containing substitutions of residues of corresponding to residues 167, 169, 171 and 175 of DP-1, fusion of proteins (II) comprising (I) or (II) and a membrane translocation of sequence (see AAW30508), expression vectors encoding (I)-(III) and sequence (see AAW30508), expression vectors encoding (I)-(III) and sequence apoptosis, control, e.g. for purging bone marrow. Surgical stents comprising cuttor, e.g. for purging bone marrow. Surgical stents comprising cuttor, or prevent restenosis in patients who cut he DNA-binding activity of DP/E2F heterodimers. They are also cused as research reagents, as positive controls in assays for capturitying antagonists of DP-1/E2F dimerisation on dissimunossay identifying antagonists of DP-1/E2F dimerisation on dissimunossay identifying antagonists of DP-1/E2F dimerisation of controls in cells, cuttoric agents. Also described is the use of sequences antisense to particularly by gene therapy. When formulated with cytotoxic or cytostatic agents, (I)-(III) enhance cell killing. Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis ô DP-1; transcription factor; antagonist; E2F protein; apoptosis; cell proliferation; cardiovascular cell; restenosis; tumour; surgical stent; therapy.
